

PROJECT: AI EXPLORER Comparison Report

Models Tested: Claude, Gemini & ChatGPT.

Overall Findings:

1. Best for Summarization: Claude/Gemini. Both hit 3 bullets, under 80 words, clear.
2. Best for Code Generation: Claude/Gemini. Both efficient, but Claude added more examples.
3. Best for Reasoning/Maths: All 3 have 100% accuracy with clear steps.
4. Best for Creative Writing: Claude/ChatGPT. Claude was vivid with Banaras imagery. ChatGPT was most emotional.
5. Best for Factual Q&A: Claude - Most accurate & complete.

Strengths & Weaknesses:

1. ChatGPT:

Strengths: Emotional writing, good accuracy.

Weaknesses: Missing data in this test.

2. Claude:

Strengths: Depth, accuracy & extra context.

Weaknesses: Can be lengthy.

3. Gemini:

Strengths: Structured & efficiency in code.

Weaknesses: Occasional factual mixing in niche topics.

Hallucination Cases:

1. Gemini in Factual Q&A: Mixed up 'Three Pillars' with 'Three Great Secret Laws'.

Reason: Similar Buddhist terminology in training data caused confusion.

Final Recommendation:

- If I need creative + accurate factual help, I would choose Claude because it balances depth and accuracy.
- For quick structured tasks, Gemini is good.
- For emotional writing, ChatGPT is good.
- Overall, for tasks Claude is most reliable because it rarely hallucinates & explains reasoning.

Task	Model	Quality	Accuracy	Format	Hallucination?
Summarization	Claude	5	5	5	N
	Gemini	5	5	5	N
	ChatGPT	4	5	5	N
Code Generation	Claude	5	5	5	N
	Gemini	5	5	5	N
	ChatGPT	5	5	5	N
Reasoning/Maths	Claude	5	5	5	N
	Gemini	5	5	5	N
	ChatGPT	5	5	5	N
Creative Writing	Claude	5	4	5	N
	Gemini	5	4	4	N
	ChatGPT	5	4	4	N
Factual Q&A	Claude	5	5	5	N
	Gemini	4	4	5	Y
	ChatGPT	4	5	5	N

AI CHATS

CLAUDE

Summarize the following article in 3 bullet points. Keep it under 80 words.
Article: "Artificial Intelligence is transforming industries by automating repetitive tasks, enabling data-driven decisions, and creating new products. However, it also raises concerns about job displacement, bias in algorithms, and privacy. Companies adopting AI must balance innovation with ethical guidelines and workforce retraining to ensure responsible growth."

4 Jul

- AI boosts efficiency by automating tasks, driving data-based decisions, and enabling new products.
- Risks include job losses, algorithmic bias, and privacy concerns.
- Companies must pair innovation with ethics and worker retraining for responsible growth.

Who was Nichiren Daishonin and what are the 3 main pillars of his Buddhist practice? Answer in 4-5 sentences.

03:16

Nichiren Daishonin (1222-1282) was a Japanese Buddhist monk who founded a school of Buddhism centered on the Lotus Sutra, which he believed contained the essential teachings of the historical Buddha for the modern age. He taught that chanting "Nam-myoho-renge-kyo" was the direct path to enlightenment for all people, regardless of status or background. His practice is often summarized around three main pillars: **Faith** (shin), a deep conviction in the power of the Lotus Sutra and the practice; **Practice** (gyo), which includes both practice for oneself (chanting daimoku and reciting sutra passages) and practice for others (sharing the teaching); and **Study** (gaku), the ongoing effort to understand Buddhist principles more deeply to strengthen one's faith and practice. Together, these three pillars are meant to help practitioners transform their lives and reveal their inherent Buddha nature. His teachings later gave rise to several Nichiren Buddhist schools and lay organizations, including Soka Gakkai, which remain active worldwide today.

A store sells apples for ₹40 per kg and oranges for ₹60 per kg. If a customer buys 3kg of apples and 2kg of oranges and pays with a ₹500 note, how much change will they get? Show your steps.

03:17

Step 1: Cost of apples

$3 \text{ kg} \times ₹40/\text{kg} = ₹120$

Step 2: Cost of oranges

$2 \text{ kg} \times ₹60/\text{kg} = ₹120$

Step 3: Total cost

$₹120 + ₹120 = ₹240$

Step 4: Change from ₹500

$₹500 - ₹240 = ₹260$

The customer will get **₹260** in change.

Write a 100-word micro-story about "Only in Banaras you find yourself dancing at 5am on the ghats". Make it emotional and vivid.

03:15

The bhajan started before the sun did. I hadn't slept — just wandered from the burning ghat where flames still whispered names, to this quieter stretch where an old man beat a dholak like it owed him something. Someone pulled my wrist. I didn't refuse.

My feet forgot they were tired. The Ganga turned gold, then silver, then herself again. Strangers became a circle, arms up, hips loose, laughing at nothing and everything. Somewhere behind us, ash and marigolds drifted downriver, indifferent to our joy.

Only here — where death and dawn share a doorstep — could grief teach me to dance.

Write a Python function called `is_prime` that takes an integer `n` and returns True if `n` is a prime number, False otherwise. Include comments and handle edge cases for `n < 2`.

4 Jul

python

```
def is_prime(n):
    """
    Check whether an integer n is a prime number.
    Returns True if n is prime, False otherwise.
    """
    # Numbers less than 2 are not prime by definition
    if n < 2:
        return False

    # 2 is the only even prime number
    if n == 2:
        return True

    # Eliminate other even numbers early
    if n % 2 == 0:
        return False

    # Check odd divisors up to the square root of n
    # (if n has a factor larger than sqrt(n), it must also have one smaller)
    i = 3
    while i * i <= n:
        if n % i == 0:
            return False
        i += 2

    return True
```

How it works:

- `n < 2` → not prime (covers negatives, 0, 1).
- `n == 2` → prime (the only even prime).
- Even numbers `> 2` → not prime, filtered out immediately.
- For odd `n`, only odd divisors up to $\sqrt{n}$ are checked, since checking beyond that is redundant.

Example usage:

python

```
print(is_prime(17)) # True
print(is_prime(1)) # False
print(is_prime(2)) # True
print(is_prime(15)) # False
```

GEMINI

Summarize the following article in 3 bullet points. Keep it under 80 words.

Article: "Artificial Intelligence is transforming industries by automating repetitive tasks, enabling data-driven decisions, and creating new products. However, it also raises concerns about job displacement, bias in algorithms, and privacy. Companies adopting AI must balance innovation with ethical guidelines and workforce retraining to ensure responsible growth."

- AI is transforming industries by automating tasks, improving decision-making, and enabling new products.
- It also creates challenges, including job displacement, algorithmic bias, and privacy concerns.
- Responsible AI adoption requires ethical practices and workforce retraining to balance innovation with sustainable growth.

Write a 100-word micro-story about "Only in Banaras you find yourself dancing at 5am on the ghats". Make it emotional and vivid.

Edit

Only in Banaras do you find yourself dancing at 5 a.m. on the ghats. The sky was still blue with sleep, while the Ganga shimmered like a whispered prayer. Temple bells echoed through the mist, and an old musician smiled as his tabla found a heartbeat. Strangers became companions, clapping, laughing, spinning without introductions or expectations. I forgot deadlines, worries, even my own name for a while. As the first rays of sunlight touched the water, tears mixed with my smile. It wasn't just a dance—it was a quiet reminder that sometimes the soul arrives before the mind finally catches up.

Who was Nichiren Daishonin and what are the 3 main pillars of his Buddhist practice? Answer in 4-5 sentences.

Nichiren Daishonin was a 13th-century Japanese Buddhist teacher who taught that enlightenment is available to everyone through faith in the Lotus Sutra. He emphasized a practical form of Buddhism centered on chanting and applying Buddhist principles in daily life. The three main pillars of his practice are **faith** (believing in one's inherent Buddha nature), **practice** (chanting *Nam-myoho-renge-kyo* and supporting others in their practice), and **study** (learning and reflecting on Buddhist teachings). Together, these pillars are intended to help practitioners develop wisdom, courage, and compassion while facing life's challenges.

A store sells apples for ₹40 per kg and oranges for ₹60 per kg. If a customer buys 3kg of apples and 2kg of oranges and pays with a ₹500 note, how much change will they get? Show your steps.

Let's calculate the total cost step by step:

1. **Cost of apples:**
 - $3 \text{ kg} \times ₹40/\text{kg} = ₹120$
2. **Cost of oranges:**
 - $2 \text{ kg} \times ₹60/\text{kg} = ₹120$
3. **Total cost:**
 - $₹120 + ₹120 = ₹240$
4. **Change from ₹500:**
 - $₹500 - ₹240 = ₹260$

Answer: The customer will receive ₹260 in change.

Write a Python function called `is_prime` that takes an integer `n` and returns `True` if `n` is a prime number, `False` otherwise. Include comments and handle edge cases for `n < 2`.

Python

Run

```
def is_prime(n):  
    """  
    Returns True if n is a prime number, False otherwise.  
  
    Args:  
        n (int): The number to check.  
  
    Returns:  
        bool: True if n is prime, False otherwise.  
    """  
  
    # Numbers less than 2 are not prime  
    if n < 2:  
        return False  
  
    # 2 is the only even prime number  
    if n == 2:  
        return True  
  
    # Exclude all other even numbers  
    if n % 2 == 0:  
        return False  
  
    # Check for divisors from 3 up to the square root of n  
    for i in range(3, int(n**0.5) + 1, 2):  
        if n % i == 0:  
            return False  
  
    # No divisors found, so n is prime  
    return True  
  
# Example usage  
print(is_prime(2))    # True  
print(is_prime(17))   # True  
print(is_prime(18))   # False  
print(is_prime(1))    # False  
print(is_prime(-5))   # False
```

CHAT GPT

Summarize the following article in 3 bullet points. Keep it under 80 words.
Article: "Artificial Intelligence is transforming industries by automating repetitive tasks, enabling data-driven decisions." ▼

Here is a quick summary of the article:

- **Industry Transformation:** AI drives growth by automating routine tasks, enabling data-backed decisions, and sparking new products.
- **Key Challenges:** The technology creates significant concerns around job displacement, algorithmic bias, and privacy risks.
- **Responsible Adoption:** To succeed, companies must balance innovation with strict ethical guidelines and proactive workforce retraining.

Write a 100-word micro-story about "Only in Banaras you find yourself dancing at 5am on the ghats". Make it emotional and vivid.

The scent of burning pyres and crushed marigolds hung thick in the translucent dawn. At Assi Ghat, the final notes of the Subah-e-Banaras morning raga dissolved into the mist. My feet, heavy with a grief I'd carried across oceans, suddenly forgot their sorrow. An old man clapped, a stranger threw flowers, and the rhythmic thrum of a stray dholak took over. Only in Banaras do you find yourself dancing at 5 a.m. on the stone steps, weeping and laughing as the rising sun bleeds gold into the Ganges, finally letting go of what was never yours to keep.

Who was Nichiren Daishonin and what are the 3 main pillars of his Buddhist practice? Answer in 4-5 sentences.

Nichiren Daishonin was a 13th-century Japanese Buddhist priest who established Nichiren Buddhism, a practice centered on the supreme authority of the Lotus Sutra. He taught that all people possess an inherent Buddha-nature and can attain enlightenment in this lifetime. The core of his practice is built upon the Three Great Secret Laws, or main pillars: the Gohonzon (the sacred mandala/object of devotion), the Daimoku (chanting the phrase *Nam-myoho-renge-kyo*), and the Kaidan (the sanctuary or place where the practice is enacted). By committing to these three pillars, practitioners aim to overcome life's sufferings and manifest absolute happiness.

A store sells apples for ₹40 per kg and oranges for ₹60 per kg. If a customer buys 3kg of apples and 2kg of oranges and pays with a ₹500 note, how much change will they get? Show your steps.

Here are the steps to calculate the change the customer will receive:

Step 1: Calculate the cost of the apples

The customer buys 3 kg of apples at ₹40 per kg.

$$\text{Cost of apples} = 3 \text{ kg} \times ₹40/\text{kg} = ₹120$$

Step 2: Calculate the cost of the oranges

The customer buys 2 kg of oranges at ₹60 per kg.

$$\text{Cost of oranges} = 2 \text{ kg} \times ₹60/\text{kg} = ₹120$$

Step 3: Calculate the total bill amount

Add the cost of the apples and oranges together.

$$\text{Total Bill} = ₹120 + ₹120 = ₹240$$

Step 4: Calculate the change to be received

Subtract the total bill from the ₹500 note paid by the customer.

$$\text{Change} = ₹500 - ₹240 = ₹260$$

The customer will get back ₹260 in change.

Write a Python function called 'is_prime' that takes an integer n and returns True if n is a prime number, False otherwise. Include comments and handle edge cases for n < 2.

Here is the Python function to check for prime numbers, optimized for efficiency using the $O(\sqrt{n})$ trial division method:

```
Python

def is_prime(n: int) -> bool:
    # Edge case: numbers less than 2 are not prime
    if n < 2:
        return False

    # 2 is the only even prime number
    if n == 2:
        return True

    # Exclude all other even numbers
    if n % 2 == 0:
        return False

    # Check odd factors up to the square root of n
    # We can skip even numbers by stepping by 2
    for i in range(3, int(n**0.5) + 1, 2):
        if n % i == 0:
            return False

    return True
```

Why this approach?

Instead of checking all numbers up to n , this function only checks up to $\sqrt{n}$. If a number n has a factor larger than its square root, it must also have a matching factor smaller than its square root. Skipping even numbers after checking 2 cuts the remaining work in half.
